

Image Analysis and Processing

First set of Exercises

24/03/2022

It is critical to explain your choices and provide comments for the outputs (intermediate and final).

Exercise 1

- Explain the impact of the following transformation function on a grayscale image, in terms of intensity values and brightness.
- Verify your answer by applying the transformation on an image of your choice (include input/output images in your answer)

Exercise 2

Propose a method for **enhancing** the image "nature_dark_forest.jpg".

Exercise 3

Propose a method for "improving" the image "pollen-500x430px-96dpi.jpg".

Exercise 4

Propose a method for sharpening the image "First-photo-of-the-moon-from-Chandrayaan-2-ISRO.jpg".

Exercise 5

One combined enhancement methods (e.g. arithmetic operations, gray level transformations, and/or sharpening spatial filters) to convert the "image_1" to "image_2".

- Try to guess the processing steps she adopted. [Note the dynamic range and brightness of the enhanced image, and the noise introduced.]
- Propose a pipeline of processes with the aim of approximating "image_1" starting from "image_2".
